**Vaccine Hesitancy in Black and Latinx communities**

ESTHER RUSH

The Community Vaccine Collaborative is working to understand and reduce vaccine hesitancy in Black and Latinx communities, as a member of the Black or Latino communities (Black, African American, Latinx, and people of color) live in or within 50 miles of Pittsburgh, or 18 years of age or older, and be able to complete the survey in English or Spanish. If you would like to take the survey or have any questions, please email Maya Ragavan (ragavanm@chp.edu) or call or text 412-515-9048. This study will not only increase our understanding of past histories of mistrust and trauma perpetrated by research and health care, but it will also help build trustworthiness more broadly.

As a pediatrician, I strongly believe in vaccines,” says Ragavan. “They save lives, and I’ll always encourage families to get vaccinated. However, I strongly believe that we can be more effective in that conversation and that we can talk about trustworthiness and mutual respect where people can feel safe to talk about their questions and concerns. For me, I think it’s really important to talk about research and what it means to be well informed about vaccines.”

**Community Vaccine Collaborative Study**

Are you interested in taking a survey about vaccines? We are conducting a research project to help understand what people think about past histories of mistrust and trauma perpetrated by research and health care, but it will also help build trustworthiness more broadly.
